# Task A

## 1. Draw an ER diagram

## 2. *Model the entities, attributes, and relationships*

### 1. **Entities:**

In our ER Diagram, we have eight strong entities. They are as follows

- Book
- Card
- Record
- Student
- Faculty
- Library Manage
- Author
- Category

We do not have any weak entities in our diagram.

There are no class hierarchies in our ER diagram.

The cardinality, total participation, and (min, max) constraints have been enumerated in our diagram.

### 2. **Attributes:**

**Book:** bno (Primary Key)/ category\_id (Foreign Key from Category)/ ISBN/ Author (Foreign Key from Author)/ bname (Title)/ press (Publisher)/ year (Year of Publication)/ total (Total Copies)/ stock (Available Copies)/ location (Library Location)

**Card:** cno (Primary Key)/ name (Cardholder Name)/ department (Department or Affiliation)/ type (Cardholder Type: Student, Faculty, Manager)

**Record:** record\_id (Primary Key)/ bno (Foreign Key from Book)/ cno (Foreign Key from Card)/ borrow\_date (Date when borrowed)/ return\_date (Date returned, nullable)/ manager\_id (Foreign Key from Library Manager)/ location (Transaction Location)

**Student:** s\_id (Primary Key)/ s\_password (Password)/ s\_email (Unique, Email)/ s\_firstname (First Name)/ s\_midname (Middle Name)/ s\_lastname (Last Name)/ age (Age)/ gender (Gender)/ contact (Phone Number)

**Faculty:** f\_id (Primary Key)/ f\_password (Password)/ f\_email (Unique, Email)/ f\_firstname (First Name)/ f\_midname (Middle Name)/ f\_lastname (Last Name)/ age (Age)/ gender (Gender)/ office (Faculty's Office)/ contact (Phone Number)

**Library Manager:** m\_id (Primary Key)/ m\_password (Password)/ m\_email (Unique, Email)/ m\_firstname (First Name)/ m\_midname (Middle Name)/ m\_lastname (Last Name)/ age (Age)/ gender (Gender)/ office (Manager's Office)/ contact (Phone Number)

**Author:** a\_id (Primary Key)/ birthday/ a\_firstname/ a\_midname/ a\_lastname

**Category:** c\_id (Primary Key)/ c\_name/ description/ parent\_id/ creation\_date/ last\_updated

### 3. Relationships:

**Own:** All the students and faculties own cards to borrow or return books, part of the cards are owned by students, and part are owned by faculties.

**Charge:** One library manager can charge many cards, and library managers can share responsibility for a single card.

**Add/delete:** One library manager can manage several records, and records can also be managed by several managers.

**Involves:** Each record is associated with exactly one book, and the same book can appear in many different records (or no record).

**Has:** This means one author can write multiple books, and a book can be co-authored by several authors.

**Belong to:** One category can contain many different books, and the same book can be associated with various categories.

### 3. Assumptions and Explanations

Our assumptions are as follows:

1. Each user (Student, Faculty, Library Manager) must have one unique library card (Card) associated with their ID. The Card serves as the identifier for borrowing and returning books.
2. Each Student, Faculty, and Library Manager must have a unique email and ID. The ID acts as a unique identifier for accounts, ensuring no duplicate users.
3. A Library Manager is responsible for managing books, including adding or deleting book records from the system. They can also manage records of borrowed and returned books. In addition, managers control the students' cards (Card) and can activate and deactivate students' cards.
4. Each book (Book) belongs to a category (Category), and each category can be associated with multiple books.
5. A Student or Faculty can borrow multiple books, but a Record must track each borrowing transaction separately, including the borrow\_date and return\_date. Students can borrow 5 books at the same time, but Faculty don't have that constraint.
6. An Author can write multiple books, and each book is associated with multiple authors.
7. A Record links a specific card number (cno) and a book number (bno) to track book borrowing and returning.
8. Each user (Student) can be either active or inactive (isActive), indicating their status in the library system.

9. A Library Manager is responsible for controlling records, borrowing and returning books, and controlling students' cards.
10. A Book must have stock information (stock, total, and location), and it can be updated by the Library Manager when the stock level changes.
11. Categories are created by library managers. They do not directly associate with books, so some categories might be empty.
12. For attributes like email address or contact that can be treated as multivalued attributes, we only allow users to enter a single value within the domain. In other words, they are all going to be single-valued attributes.

# Task B

## 1. ER to Relational Mapping Algorithm

### Step 1: Mapping of Regular Entity Types

In my database, there are a total of 6 strong entities, each uniquely identified by its own primary key or composite primary key. These entities include structured data that is crucial for maintaining referential integrity and ensuring the uniqueness of records within the system.

Record

|     |     |             |             |            |                  |          |
|-----|-----|-------------|-------------|------------|------------------|----------|
| bno | cno | borrow_data | return_data | manager_id | <u>record_id</u> | Location |
|-----|-----|-------------|-------------|------------|------------------|----------|

Card

|            |      |            |      |
|------------|------|------------|------|
| <u>cno</u> | name | department | type |
|------------|------|------------|------|

Book

|            |             |        |       |      |       |       |       |          |
|------------|-------------|--------|-------|------|-------|-------|-------|----------|
| <u>bno</u> | category_id | b_name | press | year | price | total | stock | Location |
|------------|-------------|--------|-------|------|-------|-------|-------|----------|

Student

|             |            |         |             |           |            |     |        |         |
|-------------|------------|---------|-------------|-----------|------------|-----|--------|---------|
| <u>s_id</u> | s_password | s_email | s_firstname | s_midname | s_lastname | age | gender | contact |
|-------------|------------|---------|-------------|-----------|------------|-----|--------|---------|

Faculty

|             |            |         |             |           |            |     |        |        |         |
|-------------|------------|---------|-------------|-----------|------------|-----|--------|--------|---------|
| <u>f_id</u> | f_password | f_email | f_firstname | f_midname | f_lastname | Age | gender | office | contact |
|-------------|------------|---------|-------------|-----------|------------|-----|--------|--------|---------|

Library Manager

|             |            |         |             |           |            |     |        |        |         |
|-------------|------------|---------|-------------|-----------|------------|-----|--------|--------|---------|
| <u>m_id</u> | m_password | m_email | m_firstname | m_midname | m_lastname | age | gender | office | contact |
|-------------|------------|---------|-------------|-----------|------------|-----|--------|--------|---------|

Author

|             |            |             |           |            |
|-------------|------------|-------------|-----------|------------|
| <u>a_id</u> | birth_date | a_firstname | a_midname | a_lastname |
|-------------|------------|-------------|-----------|------------|

Category

|             |        |             |           |               |              |
|-------------|--------|-------------|-----------|---------------|--------------|
| <u>c_id</u> | c_name | description | parent_id | creation_date | last_updated |
|-------------|--------|-------------|-----------|---------------|--------------|

## **Step 2: Mapping of Weak Entity Types**

Since we don't have weak entities in our ER diagram, we don't need to perform the mapping for the weak entity types.

## **Step 3: Mapping of Binary 1:1 Relationship Types**

1. Relationship: own (between Card and Student/Faculty)

Each Card is associated with exactly one Student or Faculty, and each Student or Faculty owns exactly one Card. Adding the cno (Card Number, PK of Card) as a foreign key in both the Student and Faculty tables. Since a Card must be owned by a Student or Faculty, we ensure the relationship by adding cno in both tables, creating a direct reference to the Card entity.

Card

| <u>cno</u> | name | department | type |
|------------|------|------------|------|
|------------|------|------------|------|

Student

| <u>s_id</u> | s_password | s_email | s_firstname | s_middlename | s_lastname | age | gender | contact |
|-------------|------------|---------|-------------|--------------|------------|-----|--------|---------|
|-------------|------------|---------|-------------|--------------|------------|-----|--------|---------|

Faculty

| <u>f_id</u> | f_password | f_email | f_firstname | f_middlename | f_lastname | Age | gender | office | contact |
|-------------|------------|---------|-------------|--------------|------------|-----|--------|--------|---------|
|-------------|------------|---------|-------------|--------------|------------|-----|--------|--------|---------|

## **Step 4: Mapping of Binary 1:N Relationship Types.**

For this step, we identified the 1 relationship between the following entity relations:

'Book' and 'Record'  $\Rightarrow$  primary key "bno" is transferred to 'Record' as 'bno'.

Record

| bno | cno | borrow_data | return_data | manager_id | <u>record_id</u> | Location |
|-----|-----|-------------|-------------|------------|------------------|----------|
|-----|-----|-------------|-------------|------------|------------------|----------|

Book

| <u>bno</u> | category_id | b_name | press | year | price | total | stock | Location |
|------------|-------------|--------|-------|------|-------|-------|-------|----------|
|------------|-------------|--------|-------|------|-------|-------|-------|----------|

**Note:**

In the case of the entities Book and Record, our N entity is Record. The primary key from the Book is already present in the Record as a foreign key with the same name.

## **Step 5: Mapping of Binary M: N Relationship Types.**

For this step, we identified N: M relationships as being between the following entity relations. For each pair of entities listed below, we will create a new relation to effectively manage the complex relationships.

1. Book and Author  $\Rightarrow$  create a new "has" relation.
2. Book and Category  $\Rightarrow$  create a new "belong to" relation.
3. Library Manager and Book  $\Rightarrow$  create a new "add/delete" relation.
4. Library Manager and Card  $\Rightarrow$  create a new "charge" relation.

#### 1. Relationship: has (between Author and Book)

For this new relation, we will take the primary keys from both the Author and the Book.

Book

|            |             |        |       |      |       |       |       |          |
|------------|-------------|--------|-------|------|-------|-------|-------|----------|
| <u>bno</u> | category_id | b_name | press | year | price | total | stock | Location |
|------------|-------------|--------|-------|------|-------|-------|-------|----------|

Author

|             |            |             |           |            |
|-------------|------------|-------------|-----------|------------|
| <u>a_id</u> | birth_date | a_firstname | a_midname | a_lastname |
|-------------|------------|-------------|-----------|------------|

Has

|            |             |
|------------|-------------|
| <u>bno</u> | <u>a_id</u> |
|------------|-------------|

This table will establish which authors have contributed to which books, allowing multiple authors for a single book and vice versa.

#### 2. Relationship: belong to (between Book and Category)

For this new relation, we will take the primary keys from both Book and Category.

Book

|            |             |        |       |      |       |       |       |          |
|------------|-------------|--------|-------|------|-------|-------|-------|----------|
| <u>bno</u> | category_id | b_name | press | year | price | total | stock | Location |
|------------|-------------|--------|-------|------|-------|-------|-------|----------|

Category

|             |        |             |           |               |              |
|-------------|--------|-------------|-----------|---------------|--------------|
| <u>c_id</u> | c_name | description | parent_id | creation_date | last_updated |
|-------------|--------|-------------|-----------|---------------|--------------|

Belong\_to

|            |             |
|------------|-------------|
| <u>bno</u> | <u>c_id</u> |
|------------|-------------|

This relation will map books to their respective categories, where each book can belong to multiple categories and each category can include multiple books.

#### 3. Relationship: Add/delete to (between Library manager and Record)

For this new relation, we will take the primary keys from the Library Manager and Record.

Record

| bno | cno | borrow_data | return_data | manager_id | <u>r_id</u> | Location |
|-----|-----|-------------|-------------|------------|-------------|----------|
|-----|-----|-------------|-------------|------------|-------------|----------|

Library Manager

| <u>m_id</u> | m_password | m_email | m_firstna<br>me | m_midna<br>me | m_lastna<br>me | age | gender | office | contact |
|-------------|------------|---------|-----------------|---------------|----------------|-----|--------|--------|---------|
|-------------|------------|---------|-----------------|---------------|----------------|-----|--------|--------|---------|

Add/delete

| <u>r_id</u> | <u>m_id</u> |
|-------------|-------------|
|-------------|-------------|

This table allows us to track which library manager added or deleted specific books from the library's collection, handling multiple books per manager and multiple managers handling the same book.

#### 4. Relationship: charge (between Library Manager and Card)

One library manager can charge many cards, and library managers can share responsibility for a single card. This is a M:N relationship, so we are going to add another relation in the schema to represent the cardinality relationship between card and manager, called charge. And we also want to include an attribute in charge relation besides the two primary keys from card and manager, called is\_Active, in order to let the manager activate or deactivate the card for students if they have not used their card for a long period of time.

Card

| <u>cno</u> | name | department | type |
|------------|------|------------|------|
|------------|------|------------|------|

Library Manager

| <u>m_id</u> | m_password | m_email | m_firstna<br>me | m_midna<br>me | m_lastna<br>me | age | gender | office | contact |
|-------------|------------|---------|-----------------|---------------|----------------|-----|--------|--------|---------|
|-------------|------------|---------|-----------------|---------------|----------------|-----|--------|--------|---------|

Charge

| <u>cno</u> | <u>m_id</u> | is_active |
|------------|-------------|-----------|
|------------|-------------|-----------|

The mapping of relationship charge establishes the cards that a library manager is responsible for or the library managers that have charged a card.

### **Step 6: Mapping of Multivalued Attributes**

Since we don't have multivalued attributes in our ER diagram, we don't need to perform the mapping for the weak entity types.

### **Step 7: Mapping of N-ary Relationship Types**

Card, Book, and Library Manager  $\Rightarrow$  Record

The "Record" table is a central entity that links three other entities via the fields cno, bno, and manager\_id. This table tracks borrowing and return dates for books, along with the library manager responsible for the transaction. It effectively establishes a three-way relationship among the entities involved. Here's a more structured representation of the tables and their fields:

Record

|     |     |             |             |            |           |          |
|-----|-----|-------------|-------------|------------|-----------|----------|
| bno | cno | borrow_data | return_data | Manager_id | record_id | Location |
|-----|-----|-------------|-------------|------------|-----------|----------|

Library Manager

|             |            |         |                 |               |                |     |        |        |         |
|-------------|------------|---------|-----------------|---------------|----------------|-----|--------|--------|---------|
| <u>m_id</u> | m_password | m_email | m_firstna<br>me | m_midna<br>me | m_lastna<br>me | age | gender | office | contact |
|-------------|------------|---------|-----------------|---------------|----------------|-----|--------|--------|---------|

Book

|            |             |        |       |      |       |       |       |          |
|------------|-------------|--------|-------|------|-------|-------|-------|----------|
| <u>bno</u> | category_id | b_name | press | year | price | total | stock | Location |
|------------|-------------|--------|-------|------|-------|-------|-------|----------|

Card

|            |      |            |      |
|------------|------|------------|------|
| <u>cno</u> | name | department | type |
|------------|------|------------|------|

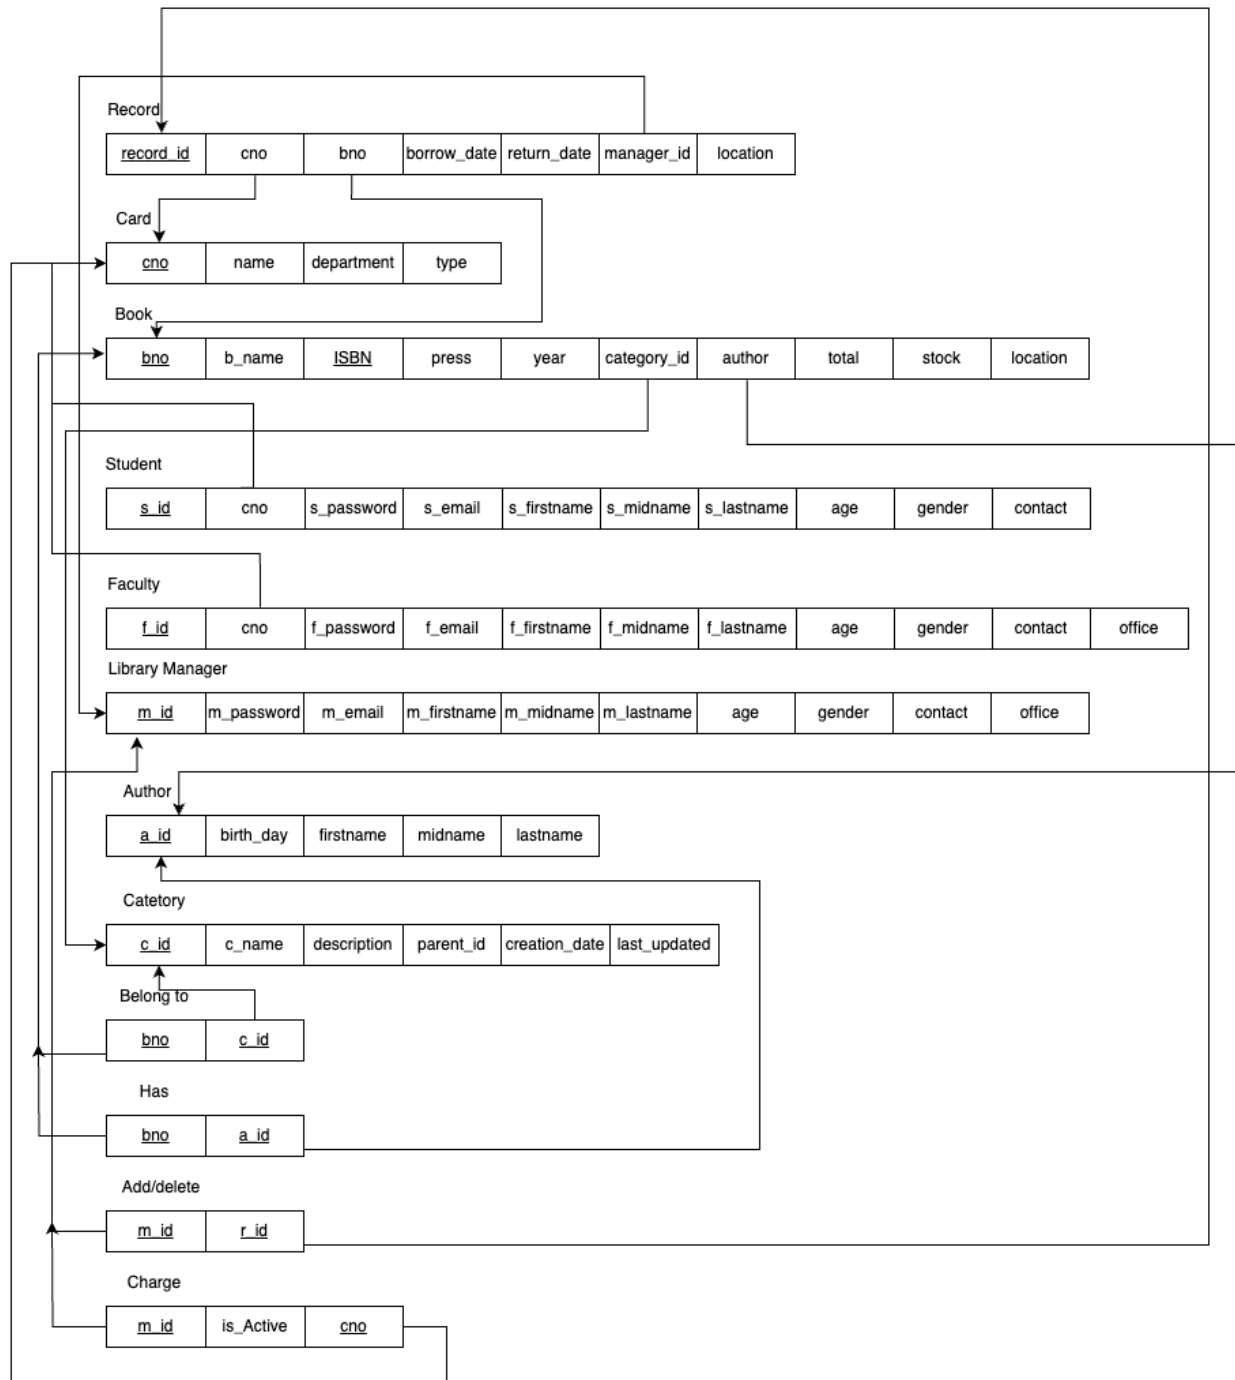

Step 8: Options for Mapping Specialization or Generalization

The ER diagram does not explicitly show any generalization or specialization relationships, so this step is not applicable.

Step 9: Mapping of Union Types (Categories)

There are no union types or categories indicated in the diagram.

## Final Relational Schema

## 2. Database Schema

### Book

| Attribute name | Type         | Key    | details          | Justification  | Description  | Action on FK      |
|----------------|--------------|--------|------------------|--|--|-------------------|
| bno            | VARCHAR(20)  | PK     | NOT NULL, Unique | Uniquely identifies each book for tracking and management.       | Unique book number; primary key identifying each book.             | Cascade on Delete |
| bname          | VARCHAR(100) |        | NOT NULL         | Essential for identification and cataloging.                     | Title of the book.   |                   |
| ISBN           | VARCHAR(100) | Unique | NOT NULL         | Required for book identification standards.                      | International Standard Book Number; a unique identifier for books. |                   |
| press          | VARCHAR(100) |        | NOT NULL         | Publisher information is crucial for bibliographic records.      | Publisher of the book.   |                   |
| Category_ID    | INT          | FK     | NOT NULL         | Links to the category table for classification                   | Category ID representing the book's genre                          | Cascade on Update |
| year           | YEAR         |        | NOT NULL         | Important for bibliographic records and copyright determination. | Year of publication.   |                   |
| author         | VARCHAR(100) |        | NOT NULL         | Authorship is critical for cataloging and legal compliance.      | Author(s) of the book.   |                   |
| total          | INTEGER      |        | NOT NULL         | Tracks total inventory of titles.                                | Total number of copies owned by the library.                       |                   |
| stock          | INTEGER      |        | NOT NULL         | Directly affects borrowing availability.                         | Number of copies currently available for borrowing.                |                   |
| Location       | VARCHAR(50)  |        | NOT NULL         | Ensures the book can be located physically in the library.       | Physical location of the book within the library.                  |                   |

### Record

| Attribute name | Type         | Key | details          | Justification  | Description   | Action on FK      |
|----------------|--------------|-----|------------------|--|---|-------------------|
| bno            | VARCHAR(20)  | KF  | NOT NULL         | Foreign key referencing the Books table to ensure referential integrity.                   | Represents the book number; foreign key referencing the Books table to ensure referential integrity.                  | Cascade on Delete |
| cno            | VARCHAR(20)  | KF  | NOT NULL         | Foreign key referencing the Card table to ensure referential integrity.                    | Represents the students, faculty number; foreign key referencing the card table to ensure referential integrity.      | Cascade on Delete |
| borrow_data    | DATE         |     | NOT NULL         | Allows tracking of unreturned books.   | Date when the book was borrowed; defaults to the current date for new records.  |                   |
| return_data    | DATE         |     | May be NULL      | Allows tracking of unreturned books.   | Date when the book was returned; can be NULL if the book hasn't been returned yet.                                    |                   |
| M_id           | VARCHAR(255) | FK  | NOT NULL         | Foreign key referencing the Library Manager table to record who processed the transaction. | Represents the Manager_ID; foreign key referencing the Library Manager table to record who processed the transaction. |                   |
| record_id      | VARCHAR(255) | PK  | NOT NULL, Unique | Uniqueness ensures that each transaction is distinct and can be referenced independently.  | Unique identifier for each record; primary key with auto-increment to ensure uniqueness.                              | Cascade on Delete |
| Location       | VARCHAR(20)  |     | NOT NULL         | Foreign key (if applicable) or NOT NULL to ensure a location is always recorded.           | Represents the location where the transaction took place or the book's location during the transaction.               | SET NULL          |

## Card

| Attribute name | Type        | Key | details          | Justification   | Description   | Action on FK |
|----------------|-------------|-----|------------------|---|---|--------------|
| cno            | VARCHAR(20) | PK  | NOT NULL, Unique | Primary key to uniquely identify each cardholder.       | Unique card number; primary key identifying each cardholder.  | CASCADE      |
| name           | VARCHAR(50) |     | NOT NULL         | Ensures every card has an associated cardholder name.   | Name of the cardholder.                                       |              |
| department     | VARCHAR(50) |     | NOT NULL         | Connects card to a department or affiliation.           | Department or affiliation of the cardholder.                  |              |
| type           | VARCHAR(20) |     | NOT NULL         | Specifies the type of cardholder to manage permissions. | Type of cardholder (e.g., student, faculty, Library Manager); |              |

## Library Manager

| Attribute name | Type         | Key    | Default          | Justification   | Description                                      | Action on FK      |
|----------------|--------------|--------|------------------|---|--|-------------------|
| M_id           | INTEGER      | PK     | NOT NULL, Unique | Primary key to uniquely identify each manager in the database.                | Unique identifier for each manager; primary key. | Cascade on Delete |
| M_password     | VARCHAR(255) |        | NOT NULL         | Security requirement to protect manager access.                               | Password for manager authentication.             |                   |
| M_Email        | VARCHAR(255) | UNIQUE | NOT NULL, Unique | Ensures each manager's email is unique.                                       | Manager's Email                                  |                   |
| M_First_name   | VARCHAR(50)  |        | NOT NULL         | Essential for personal identification and records.                            | First Name of the manager.                       |                   |
| M_Middle_name  | VARCHAR(50)  |        | Nullable         | Optional based on cultural naming practices or availability.                  | Middle Name of the manager.                      |                   |
| M_Last_name    | VARCHAR(50)  |        | NOT NULL         | Essential for personal identification and records.                            | Last Name of the manager.                        |                   |
| M_Age          | NUMBER       |        | Nullable         | Useful for demographic analysis or policy enforcement.                        | Manager's Age.                                   |                   |
| Gender         | char(1)      |        | Nullable         | Used for demographic analysis and potentially for personalized communication. | Manager's Gender.                                |                   |
| Office         | VARCHAR(50)  |        | Nullable         | Optional; useful if physical location tracking within premises is needed.     | Manager's Office.                                |                   |
| M_contact      | VARCHAR(50)  |        | Nullable         | Optional; provides a method for direct contact.                               | Contact information for the manager.             |                   |

## Faculty

| Attribute name | Type         | Key    | Default          | Justification   | Description                                     | Action on FK      |
|----------------|--------------|--------|------------------|---|---|-------------------|
| cno            | INTEGER      | Unique |                  | Uniquely identifies a condition or context associated with the student. | Faculty Card ID.                                | Cascade on Delete |
| F_Id           | INTEGER      | PK     | NOT NULL, Unique | Primary key to uniquely identify each Faculty in the database.          | Unique identifier for the Faculty; primary key. | Cascade on Delete |
| F_password     | VARCHAR(255) |        | NOT NULL         | Security requirement to protect Faculty access.                         | Password for Faculty authentication.            |                   |
| F_Email        | VARCHAR(255) | Unique | NOT NULL, Unique | Each email address is unique to each individual manager.                | Faculty's Email                                 |                   |
| F_First_name   | VARCHAR(50)  |        | NOT NULL         | Essential for personal identification and records.                      | First Name of the Faculty.                      |                   |
| F_Middle_name  | VARCHAR(50)  |        | Nullable         | Optional based on cultural naming practices.                            | Middle Name of the Faculty.                     |                   |
| F_Last_name    | VARCHAR(50)  |        | NOT NULL         | Essential for personal identification and records.                      | Last Name of the Faculty.                       |                   |
| F_Age          | NUMBER       |        | Nullable         | Useful for demographic analysis or ensuring age-related policies.       | Faculty's Age.                                  |                   |
| F_Gender       | char(1)      |        | Nullable         | Used for demographic analysis and personal identification.              | Faculty's Gender.                               |                   |
| F_Office       | VARCHAR(50)  |        | Nullable         | Optional and can be left blank if not applicable.                       | Faculty's Office.                               |                   |
| F_contact      | VARCHAR(50)  |        | Nullable         | Optional for flexibility in providing contact information.              | Contact information for the faculty.            |                   |

## Student

| Attribute name | Type         | Key details | Default          | Justification  | Description                                      | Action on FK      |
|----------------|--------------|-------------|------------------|--|--|-------------------|
| cno            | INTEGER      | Unique      |                  | Uniquely identifies a condition or context associated with the student.                  | Students Card ID.                                | Cascade on Delete |
| Student_Id     | INTEGER      | PK          | NOT NULL, Unique | Unique identifier for each student to be able to identify every student in the database. | Unique identifier for each Student; primary key. | Cascade on Delete |
| S_password     | VARCHAR(255) |             | NOT NULL         | Security requirement to protect student access.  | Password for Student authentication.             |                   |
| S_Email        | VARCHAR(255) | Unique      | NOT NULL, Unique | Every email address is unique to each individual student.                                | Student's email.                                 |                   |
| S_First_name   | VARCHAR(50)  |             | NOT NULL         | Essential for personal identification and records.                                       | First name of the Student.                       |                   |
| S_Middle_name  | VARCHAR(50)  |             | Nullable         | Optional based on cultural naming practices.   | Middle name of the Student.                      |                   |
| S_Last_name    | VARCHAR(50)  |             | NOT NULL         | Essential for personal identification and records.                                       | Last name of the Student                         |                   |
| S_Age          | NUMBER       |             | Nullable         | Age can be useful for demographic analysis and service eligibility.                      | Student's age                                    |                   |
| S_Gender       | char(1)      |             | Nullable         | Can be used for demographic analysis and personal identification.                        | Char to determine if Student is male or female.  |                   |
| S_contact      | VARCHAR(50)  |             | Nullable         | Contact information is crucial for communication but may not always be required.         | Contact information (Phone number).              |                   |

## Category

| Category       |              |         |                  |   |                                       |                    |
|----------------|--------------|---------|------------------|---|---------------------------------------|--------------------|
| Attribute name | Type         | Key     | details          | Justification                             | Description                           | Action on FK       |
| C_id           | INT          | Primary | Not Null, Unique | Unique identifier for each entry          | Customer ID                           | Cascade on Delete  |
| C_name         | VARCHAR(255) |         | Not Null         | Used for identifying customer by name     | Customer Name                         |                    |
| description    | TEXT         |         | Nullable         | Additional information about the customer | Description of the customer           |                    |
| Parent_ID      | INT          | FK      | Nullable         | Links to the parent entity if applicable  | ID of the parent customer             | Set Null on Delete |
| Creation_data  | DATE         |         | Not Null         | To record when the entry was created      | Date when the customer was registered |                    |
| Last_updated   | TIMESTAMP    |         | Not Null         | To know when the entry was last updated   | Timestamp of the last update          |                    |

## Author

| Attribute name | Type         | Key | details          | Justification                                | Description            | Action on FK      |
|----------------|--------------|-----|------------------|--|------------------------|-------------------|
| A_First_name   | VARCHAR(255) |     | NOT NULL         | Essential for personal identification        | Author's first name    |                   |
| A_Middle_name  | VARCHAR(255) |     | NOT NULL         | Not all authors have a middle name           | Author's middle name   |                   |
| A_Last_name    | VARCHAR(255) |     | NOT NULL         | Essential for personal identification        | Author's last name     |                   |
| A_ID           | INT          | PK  | NOT NULL, Unique | Unique identifier for each author            | Author ID              | Cascade on Delete |
| birth_date     | DATA         |     | NOT NULL         | Necessary to provide age-related information | Author's date of birth |                   |

## Belong\_to

| Belong_to      |             |     |                     |  |  |                   |
|----------------|-------------|-----|---------------------|--|--|-------------------|
| Attribute name | Type        | Key | details             | Justification  | Description  | Action on FK      |
| bno            | VARCHAR(20) | PK  | NOT NULL,<br>Unique | Uniquely identifies each book for tracking and management. | Unique book number; primary key identifying each book. | Cascade on Delete |
| C_id           | INT         |     | Not Null,<br>Unique | Unique identifier for each entry                           | Customer ID  | Cascade on Delete |

## Has

| Has            |             |     |                     |  |  |                   |
|----------------|-------------|-----|---------------------|--|--|-------------------|
| Attribute name | Type        | Key | details             | Justification  | Description  | Action on FK      |
| bno            | VARCHAR(20) | PK  | NOT NULL,<br>Unique | Uniquely identifies each book for tracking and management. | Unique book number; primary key identifying each book. | Cascade on Delete |
| A_ID           | INT         |     | NOT NULL,<br>Unique | Unique identifier for each author                          | Author ID  | Cascade on Delete |

## Add/delete

| Add/ Delete    |              |     |                     |   |  |                   |
|----------------|--------------|-----|---------------------|---|--|-------------------|
| Attribute name | Type         | Key | details             | Justification   | Description  | Action on FK      |
| M_id           | INTEGER      | PK  | NOT NULL,<br>Unique | Primary key to uniquely identify each manager in the database.                            | Unique identifier for each manager; primary key.   | Cascade on Delete |
| record_id      | VARCHAR(255) |     | NOT NULL,<br>Unique | Uniqueness ensures that each transaction is distinct and can be referenced independently. | Unique identifier for each record; primary key with auto-increment to ensure uniqueness. | Cascade on Delete |

## Charge

| Charge         |         |     |                     |   |  |  |
|----------------|---------|-----|---------------------|---|--|--|
| Attribute name | Type    | Key | details             | Justification   | Description  | Action on FK   |
| M_id           | INTEGER | PK  | NOT NULL,<br>Unique | Primary key to uniquely identify each manager in the database.          | Unique identifier for each manager; primary key.                           | Cascade on Delete  |
| cno            | INTEGER |     |                     | Uniquely identifies a condition or context associated with the student. | Faculty Card ID.   | Cascade on Delete  |
| is_Active      | Boolean |     | NOT NULL            | Status flag (active/inactive).  | Helps in identifying whether a charge is currently applicable or archived. | Represents whether the charge is currently active in the system. |
